Live Show Radar · AI Concert Alert Agent for Karan — Components Map

Trigger → Input → Context → Processing → AI → Output | Never miss a concert by Karan's 60 favourite artists in Bengaluru, Mumbai and Chennai | v2 · updated 12 Oct 2026

Actor	Trigger	Input	Context	Processing	AI	Output
Karan (User)	**2** Karan opens the app; it checks for updates right away (catch-up scan, at most once every 2 min)					**13** Karan taps "Got early-bird", "Going", "Remind me" or "Skip" 🎉 — this decides which reminders reach his inbox
Scheduler (cron-job.org + Vercel Cron)	**1** Alarm clock: scan every 5 min · Google search daily 09:00 IST · Gemini web check hourly · daily reset 00:05 IST					
Datasets (Neon Postgres)		**3** artist.db: Karan's 60 artists (44 with dates, 16 "waiting for dates"), the city rules, real shows and daily sample drops				**9** Saves everything like a notebook — each alert has a unique key, so Karan never gets the same email twice
Live Event API (SerpApi Google · SearchApi.io backup)		**4** Asks Google daily: "concerts in Bengaluru / Mumbai / Chennai" and reads the events listings; backup provider steps in if a call fails				
System (App Backend)			**6** Gets ready: who is Must-see, which cities alert, what Karan was already told, and what he tapped	**7** Detector spots new shows & festival lineups; Reminder spots early-birds opening/closing, show week, tonight; one nudge after 6 h		
AI Model (Gemini 3.8 Flash)		**5** Every hour Gemini searches the web (Google Search grounding) for brand-new announcements, 3 artists at a time			**8** Gemini matches each concert to the right artist, writes a fun Hinglish line, and judges "worth the trip?" — never writes dates or prices	
Email Service (Resend → Karan's inbox: snehalbandi5 @gmail.com)						**10** New-show emails always; reminder emails only for shows Karan tapped "Remind me" or "Going". Who, where, when, early-bird deadline, where to buy
Dashboard (Radar App)						**11** Radar (urgent early-birds, event stream), Shows, Calendar, Artists, My Plans, Inbox, and a Live Feed proving every Google search
Owl Mascot (UI only, no scanning)						**12** A cute owl. Tap it: it flies up, hovers, lands, and says when the app last checked. Just for fun — it never searches

Flow (step by step)

1. The alarm clock rings: every 5 minutes the app checks for alerts, every morning (09:00 IST) it searches Google, every hour Gemini checks the news, and at 00:05 the day resets.
2. When Karan opens the app, it also checks straight away (never more than once every 2 minutes).
3. The app reads its database: Karan's 60 artists, the city rules, the real shows and the daily sample drops.
4. It asks Google through SerpApi which concerts are coming to Bengaluru, Mumbai and Chennai (SearchApi.io takes over automatically if a call fails).
5. Every hour, Gemini (with Google Search) looks for brand-new announcements, 3 artists per run.
6. The app remembers who Karan loves most, which cities matter, what he was already told and what he tapped.
7. The Detector spots new shows and festival lineups; the Reminder spots early-birds about to open or close, a show next week, a show tonight; one nudge if a critical alert is ignored for 6 hours.
8. Gemini matches each concert to the right artist, writes a fun message and gives a "worth the trip?" verdict for Mumbai/Chennai Must-see shows.
9. Everything is saved with a unique key, so the same email is never sent twice; failed sends are retried up to 5 times.
10. Karan gets an email for every new show; reminder emails come only for shows he tapped "Remind me" or "Going", so his inbox never feels like spam.
11. Karan's screen shows what to grab now, every upcoming show by city, a 6-month calendar, his plans, and proof of every Google search.
12. The owl is just for fun: it flies up and down and says when the app last checked.
13. Karan taps "Got early-bird", "Going", "Remind me" or "Skip" (with a confetti burst), and the app reminds him only about what he cares about.
